

# Meeting 17

## Chapter 6

6-1 & 6-6

# *Escoamento Externo*

- **Escoamento Externo e Interno**
- **Perfil de Velocidades e a lei de não deslizamento**
- **Tensão de cisalhamento e a Lei de Newton**
- **Características da Camada Limite**
- **Regime de Escoamento: Laminar e Turbulento**
- **Arrasto Viscoso**
- **Efeitos do Gradiente de Pressão**
- **Arrasto de Forma**

# *Escoamento Externo x Interno*

Escoamentos externos não são confinados por paredes .

Escoamentos internos possuem fronteiras que limitam ou restringem o campo de escoamento

# *Escoamento Laminar x Turbulento*

152. Generation of turbulence by a grid. Smoke wires show a uniform laminar stream passing through a  $\frac{1}{16}$ -inch plate with  $\frac{1}{4}$ -inch square perforations. The Reynolds num-

ber is 1500 based on the 1-inch mesh size. Instability of the shear layers leads to turbulent flow downstream. Photograph by Thomas Corke and Hassan Nagib

# *More Definitions*

- *Laminar flow -- a highly ordered flow where fluid molecules follow one another in an smooth fashion.*
- *Turbulent flow -- disordered flow where the positions of molecules are not so easily predictable. The flow is in some sense chaotic.*
- *Laminar or turbulent conditions greatly affect pumping power required and heat transfer rates. (We will not consider this distinction further.)*
- *Movie: Reynolds experiment*

# *More Definitions*

- *Flows where density variations are unimportant are called incompressible.*
- *In this course all our flows for fluid mechanics purposes will be incompressible.*

# *More Definitions*

- *A fluid moves by force or naturally.*
- *In forced flow (forced convection) energy is added to the flow by a fan or pump or compressor that forces it to flow.*
- *In natural flow (natural convection) natural forces such as gravity or buoyancy cause the fluid to flow.*

# *Perfil de Velocidades e a Lei de Não Deslizamento*

Fig. 21. Velocity profile in the laminar boundary layer (0.01% salt water, free stream velocity 0.6 cm/s, distance from the leading edge 200 mm,  $Re = 1.2 \times 10^2$ , hydrogen bubble method).

Fig. 21. Velocity profile in the laminar boundary layer (0.01% salt water, free stream velocity 0.6 cm/s, distance from the leading edge 200 mm,  $Re = 1.2 \times 10^2$ , hydrogen bubble method).

**Perfil 'médio' de  
Velocidade  
p/ regime  
Turbulento**

*O fluido adere à parede sólida. A velocidade do fluido junto à parede é igual à velocidade da parede sólida. [No-Slip Movie](#)*

# *Definition of a fluid*

- *What is the difference between a fluid and a solid?*
- *A fluid deforms continuously when subjected to a shearing (tangential) stress, no matter how small the shearing stress.*
- *Movie: [Flow element deformation](#)*

# *Shearing of a Solid (a) and a Fluid (b)*

**Fig. 1.1** Behavior of (a) solid and (b) fluid, under the action of a constant shear force.

The crosshatching represents (a) solid plates or planes bonded to the solid being sheared and (b) two parallel plates bounding the fluid in (b).

The fluid might be a thick oil or glycerin, for example.

# *Shearing of a Fluid*

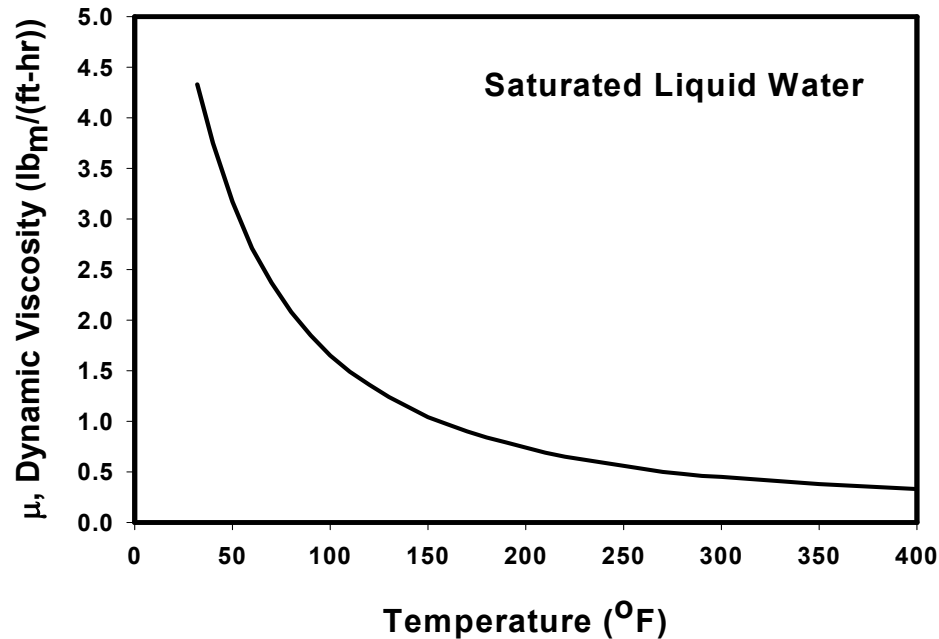

- *It can be shown that the shear stress  $\tau$  is given by*

$$\tau = \mu \frac{du}{dy}$$

- *The term  $du/dy$  is known as the **velocity gradient** and as the **rate of shear strain**.*
- *The coefficient is the coefficient of **dynamic viscosity**,  $\mu$ .*

# *Dynamic Viscosity, $\mu$*

- *Intensive property.*
- *Dependent upon both **temperature** and **pressure** for a single phase of a pure substance.*
- *Pressure dependence is usually weak and temperature dependence is important.*
- *Movie: **Liquid with low and high viscosity***

# *Dynamic viscosity of common fluids*

# *Shearing of a Fluid*

- *Engineering fluids are mostly Newtonian. Examples are water, refrigerants and hydrocarbon fluids (e.g., propane).*

$$\tau = \mu \frac{du}{dy}$$

- *Examples of non-Newtonian fluids include toothpaste, ketchup, and some paints. Non-Newtonian  
Movie*

# N. Reynolds e seu Efeito no Escoamento

Região onde predominam efeitos viscosos com presença de gradientes de velocidade, [Movie](#)

$$Re = \frac{\rho V L}{\mu} = \frac{[\text{Termos Inerciais}]}{[\text{Termos Viscosos}]}$$

# Características da Camada Limite

Figura 6.2 Camada limite hidrodinâmica sobre uma placa plana.

Fig. 20. Development of laminar boundary layer (0.01% salt water, free stream velocity 0.1 cm/s, thickness of the plate 0.5 mm, hydrogen bubble method)

## *Características da Camada Limite*

- Ocorre para  $Re$  elevados,  $Re \gg 1$
- Perfil velocidades atinge  $U_{ext}$  para uma distância  $\delta$  da parede.  $\delta$  é a espessura da camada limite,  $\delta/L \ll 1$ ,
- A C.L. é uma região de alto gradiente de velocidade confinada próxima a parede sólida
- Externo a C.L.  $U_{ext}$  é governado por Bernoulli, efeitos viscosos ficam confinados na C.L.
- A C.L. pode ser Laminar ou Turbulenta.

# Características da Camada Limite

**Figura 6-6** Camadas limites térmica e hidrodinâmica num escoamento sobre placa plana.

**N. Prandtl,  $Pr$**

$$Pr = \frac{\nu}{\alpha} = \frac{\delta}{\delta_T}$$

**Onde  $\nu$  é a viscosidade cinemática e  $\alpha$  é a difusividade térmica.**

**O  $Pr$  pode ser interpretado como a razão entre as espessuras das C.L. Hidrodinâmica e térmica.**

# *Arrasto Viscoso*

- O arrasto viscoso é devido exclusivamente às forças viscosas que atuam nas paredes sólidas.
- A tensão de cisalhamento na parede é uma força localizada. Ela é avaliada pelo produto entre o gradiente de velocidade na parede e a viscosidade dinâmica do fluido.
- Frequentemente ela é expressa por meio do Coeficiente de Atrito,  $C_f$ , de Fanno:

$$\tau_w = \mu \left. \frac{dU}{dy} \right|_{\text{parede}} \quad C_f = \frac{\tau_w}{(1/2)\rho U_{\text{ext}}^2}$$

$$D = \frac{1}{2} \rho U_{\text{ext}}^2 \cdot C_f \cdot [\text{Área Molhada Corpo}]$$

# Arrasto Viscoso

- A força de arrasto viscoso total num corpo, é avaliada a partir da integração do arrasto localizado ao longo do corpo. Frequentemente ela é expressa em termos do coeficiente de atrito médio

$$\bar{C}_f = \frac{1}{(1/2)\rho U_{\text{ext}}^2} \frac{\int_A \tau_w \cdot dA}{A}$$

$$\bar{D} = \frac{1}{2} \rho U_{\text{ext}}^2 \cdot \bar{C}_f \cdot A$$

# Arrasto Viscoso

- Arrasto viscoso em uma placa plana com ausência de gradiente de pressão:

Tabela 6-1 Resumo das relações da camada limite para uma placa plana lisa

Laminar

$$\text{Re}_x < 5 \times 10^5$$

$$u/U = f(y\sqrt{U/\nu x})$$

Veja Tabela 6-2

$$\delta/x = 5,0 \text{Re}_x^{-1/2}$$

$$\tau_p = 0,332\rho U^2 \text{Re}_x^{-1/2}$$

$$C_{fx} = 0,664 \text{Re}_x^{-1/2}$$

$$\bar{C}_f = 1,328 \text{Re}_L^{-1/2}$$

Turbulento

$$5 \times 10^5 < \text{Re}_x < 10^7$$

$$u/U \cong (y/\delta)^{1/7}$$

$$\delta/x = 0,371 \text{Re}_x^{-1/5}$$

$$\tau_p = 0,0296\rho U^2 \text{Re}_x^{-1/5}$$

$$C_{fx} = 0,0592 \text{Re}_x^{-1/5}$$

$$\bar{C}_f = 0,074 \text{Re}_L^{-1/5}$$

# *Gradiente de Pressão & Separação*

# Gradiente de Pressão & Separação

Fig. 105. Velocity distribution in a divergent passage (water, velocity = 3.0 cm/s, inlet width = 30 mm, divergence angle = 20°,  $Re = 900$ , hydrogen bubble method).

# Gradiente de Pressão & Separação

Fig. 105. Velocity distribution in a divergent passage (water, velocity = 3.0 cm/s, inlet width = 30 mm, divergence angle = 20°,  $Re = 900$ , hydrogen bubble method).

# Cylinder Separation Movie

Fig. 3. Flow around a circular cylinder at  $Re = 19$  (water, flow velocity 0.20 cm/s, cylinder diameter 1.0 cm, aluminium powder method and electrolytic precipitate method).

Fig. 4. Flow around a circular cylinder at  $Re = 26$  (water, flow velocity 0.25 cm/s, cylinder diameter 1.0 cm, aluminium powder method).

Fig. 5. Flow around a circular cylinder at  $Re = 55$  (water, flow velocity 0.55 cm/s, cylinder diameter 1.0 cm, aluminium powder method).

# Gradiente de Pressão & Separação

Fig. 22. Water, velocity of motion 2 cm/s, cylinder diameter 70 mm, photographed two seconds after the start of motion,  $Re = 1.2 \times 10^3$ , hydrogen bubble method.

**A Distribuição de Pressão no  
Corpo Causa uma Força  
Resultante Contrária ao  
Escoamento?**

**A Separação (Descolamento) do  
Escoamento Altera a Distribuição  
de Pressão no Corpo?**

**Ela Tem Influência na Força de  
Arrasto do Corpo?**

# Arrasto de Forma (Distribuição de Pressão)

## Bluffy Body Movie

55. Instantaneous flow past a sphere at  $R=15,000$ . Dye in water shows a laminar boundary layer separating ahead of the equator and remaining laminar for almost one

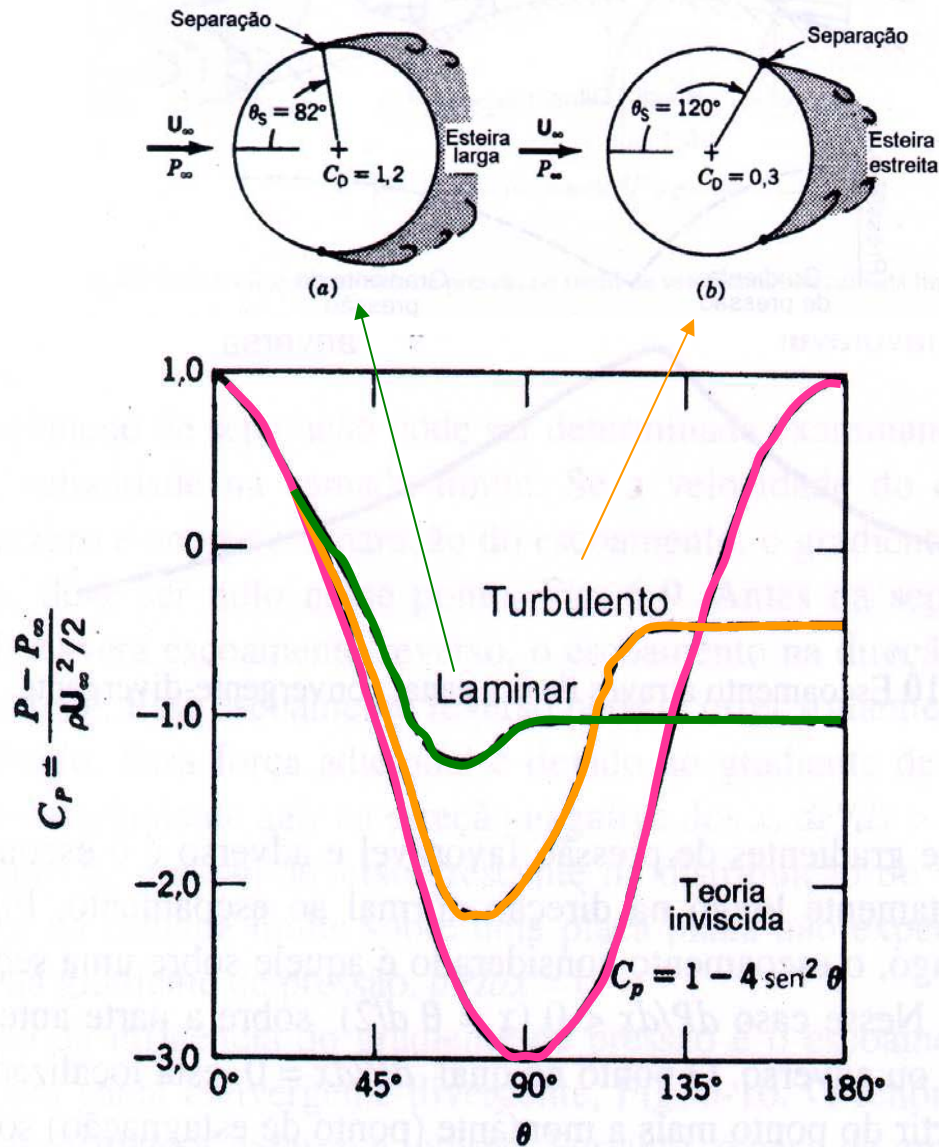

radius. It then becomes unstable and quickly turns turbulent. ONERA photograph, Werlé 1980

57. Instantaneous flow past a sphere at  $R=30,000$  with a trip wire. A classical experiment of Prandtl and Wieselsberger is repeated here, using air bubbles in water. A wire hoop ahead of the equator trips the boundary layer. It becomes turbulent, so that it separates farther

rearward than if it were laminar (opposite page). The drag is thereby dramatically reduced, in a way that occurs naturally on a smooth sphere only at a Reynolds number ten times as great. ONERA photograph, Werlé 1980

# Distribuição de Pressão Não Simétrica Em Cilindros

**Figura 6-11** Pressão de escoamento e de superfície sobre um cilindro circular infinito normal ao escoamento. (a) Escoamento laminar, (b) Escoamento turbulento.

# Arrasto de Forma (Distribuição de Pressão)

**Camada Limite**

**(a) Laminar & (b) Turbulento**

# *Drag*

$$F_{D, friction} = C_{D, friction} \times \frac{1}{2} \rho V^2 A$$

$$F_{D, pressure} = C_{D, pressure} \times \frac{1}{2} \rho V^2 A$$

$$F_{D, total} = F_{D, pressure} + F_{D, friction}$$

# Arrasto Total

O arrasto de forma e o viscoso constituem os dois mecanismos que causam a força de arrasto num corpo.

$$\bar{\mathbf{D}}_T = \bar{\mathbf{D}}_P + \bar{\mathbf{D}}_f$$

Arrasto  
Total

Arrasto  
Forma

Arrasto  
Viscoso

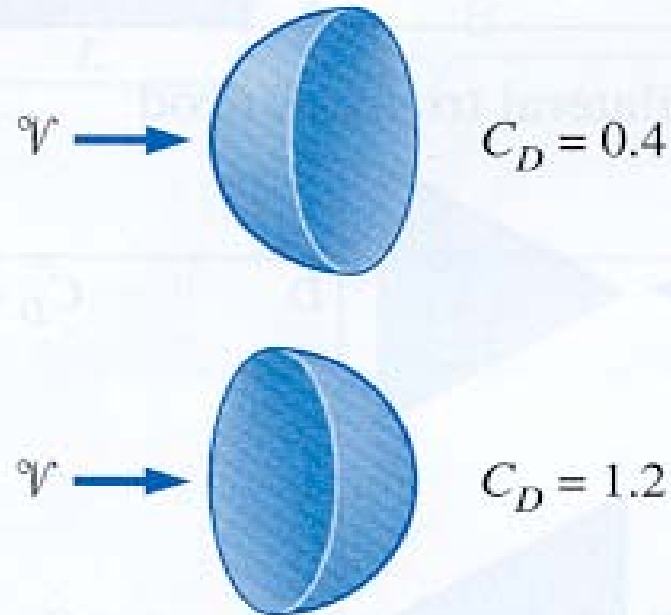

$$C_D = \frac{\bar{\mathbf{D}}_T}{(1/2)\rho U_{\text{ext}}^2 \cdot A}$$

# Drag

- *Drag is very geometry dependent.*
- *Tables 13-1 and 13-2 have drag coefficients for some common shapes.*

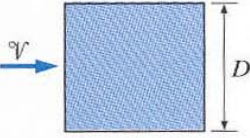

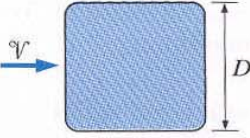

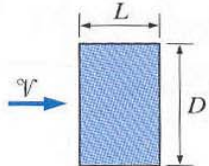

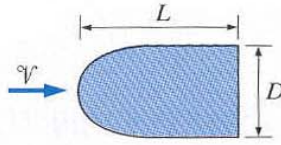

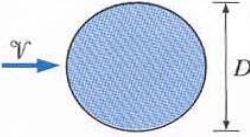

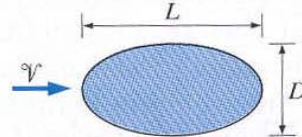

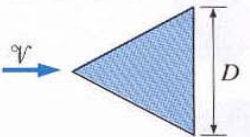

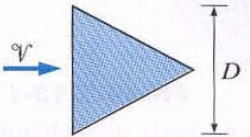

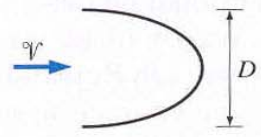

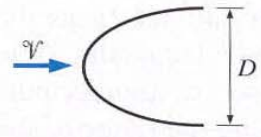

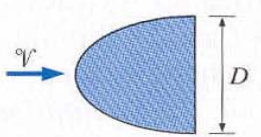

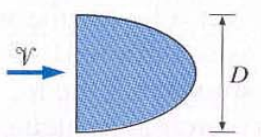

A hemisphere at two different orientations for  $Re > 10^4$

Movie: [Geometry Drag Dependency](#)

# TEAMPLAY

- The drag coefficient of a vehicle increases when its windows are rolled down or its sunroof is opened. A sports car has a frontal area of  $2.04 \text{ m}^2$  and a drag coefficient of  $0.32$  when the windows and sunroof are closed. The drag coefficient increases to  $0.41$  when the sunroof is open. Determine the additional power consumption of the car at (a)  $50 \text{ km/h}$  and (b)  $120 \text{ km/h}$  when the sunroof is opened. Take the density of air to be  $1.16 \text{ kg/m}^3$ .*

**FIGURE P13-40E**
